What is it, and who is it for?

a peer-to-peer ride-hailing
protocol that connects riders and
drivers directly, without
intermediaries

Why now?

The network model is broken

Networks don't make money

Uber | Get | FreeNow ...

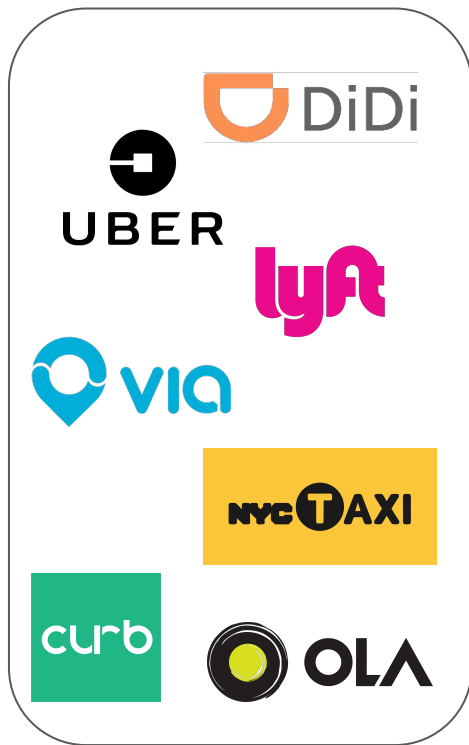

Drivers pay high service fees

Paying 20%+ commission

Passenger experience is often poor

Availability | Time to pickup | Cancellations | Surge pricing

The Problem

High and opaque service fees

Drivers and riders are constrained to rely on service providers whose interests are not directly aligned with theirs

High barriers to entry

- Innovation within the ride-hailing industry is hindered
- The cost of acquiring a critical mass of users is prohibitive

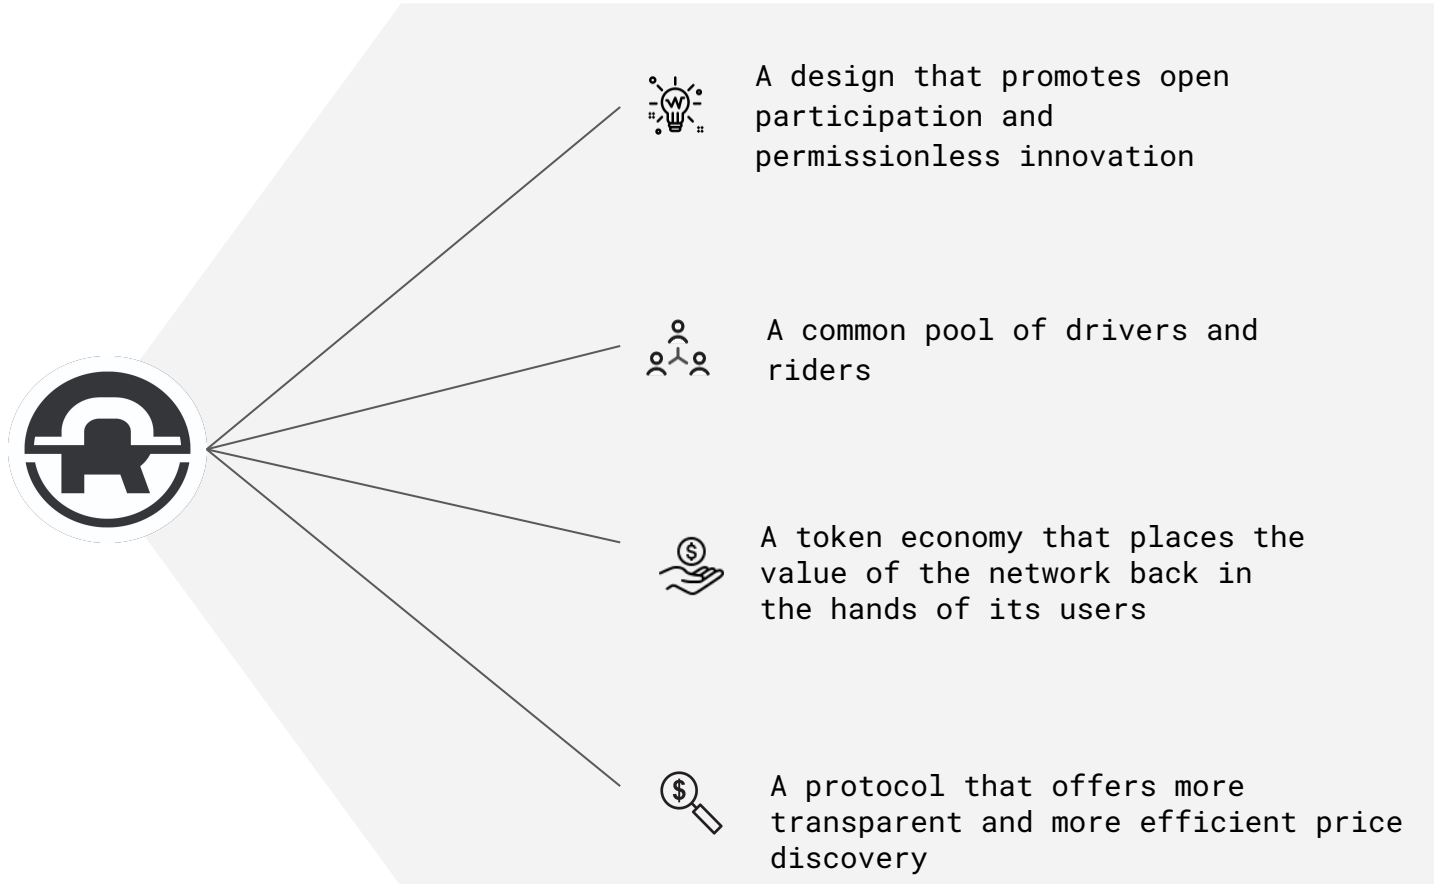

Siloed Applications

- Each application has a separate user base
- No shared pool of drivers/riders

Centralized

No platform exist that is truly owned and operated by the community that uses it

Proposed Solution

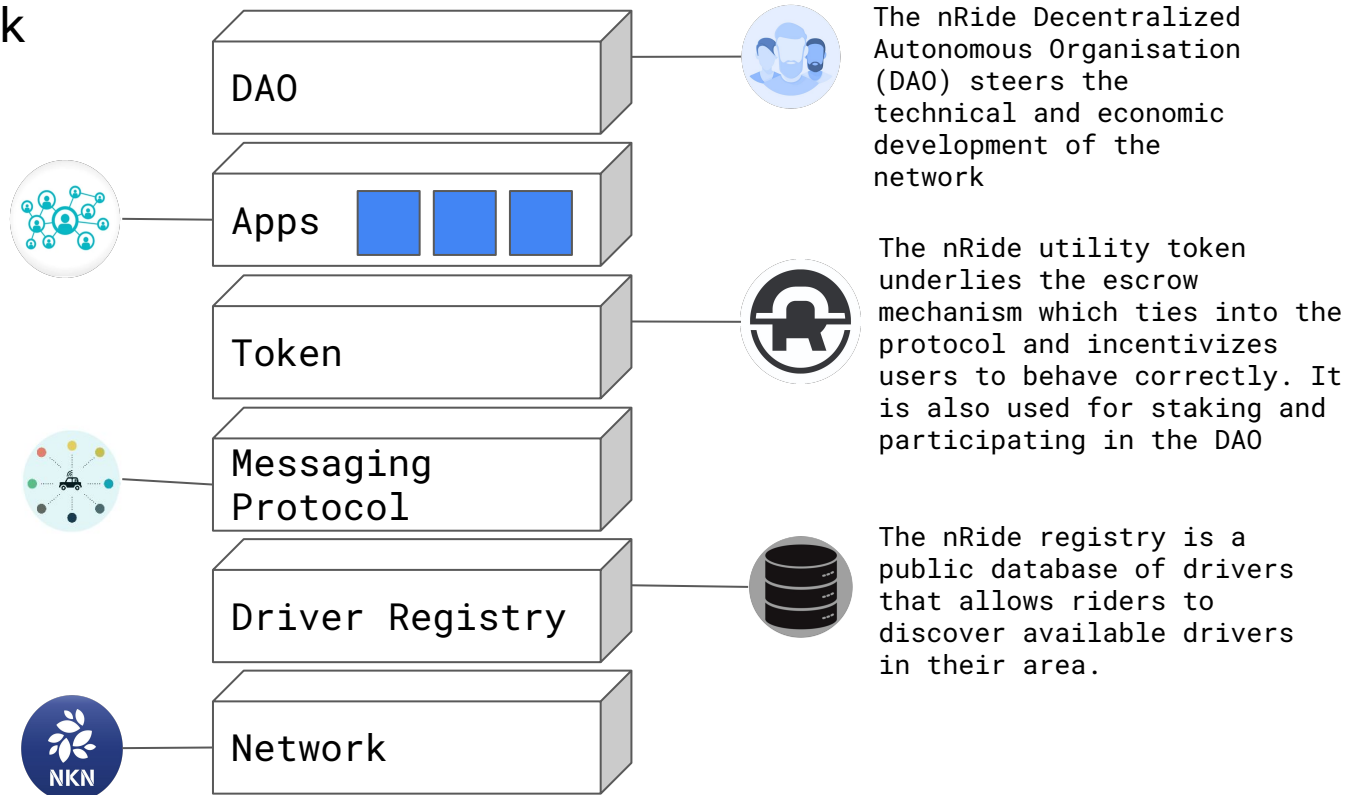

Proposed Solution

The nRide Stack

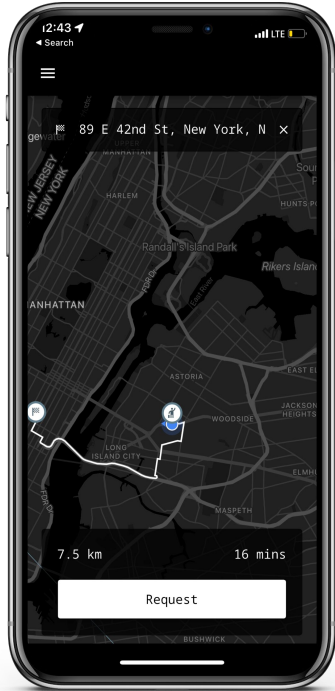

Mobile applications that implement the nRide protocol can tap into a common pool of drivers and riders with minimal development effort and infrastructure costs

The messaging protocol specifies the format and sequence of messages to be exchanged over the network in order to agree on a journey and coordinate a pickup

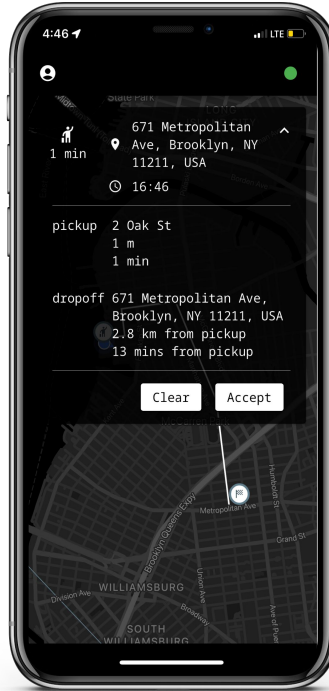

The p2p networking solution enables drivers and riders to talk directly to each other without relying on a central third party

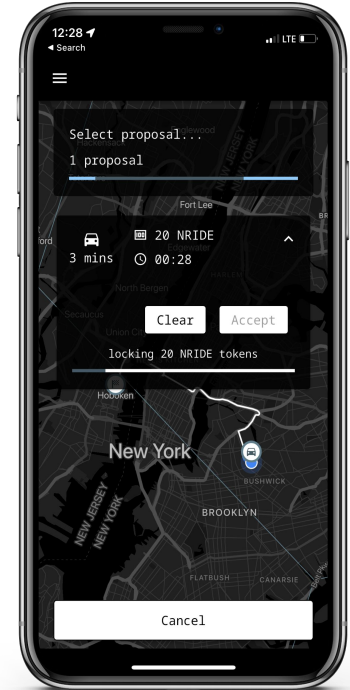

nRide Application

Passenger - Request

Driver - Accept

Passenger - Confirmed

Milestones

nRide started at the Gitcoin Hackathon in late 2021 and, with the support of strategic partners, evolved into a more ambitious project to disrupt the ride-hailing industry

Appendix

P2P Network

Users connect directly to one another
without a central authority

Blockchain-based
decentralized
overlay network

- No need for public IP or port forwarding
- Optimized routing
- Private and secure delivery

Scalable localised
user discovery

- Smart-Contract Driver Registry
- Drivers register to area topic
- Riders publish requests to area topic

Users only interact with other
users in their vicinity

Driver Registry

nRide compatible apps share
a common pool of users.

Messaging Protocol

1

Request - Passenger broadcasts a pickup request

2

Proposal - Drivers send proposals directly back to passenger

3

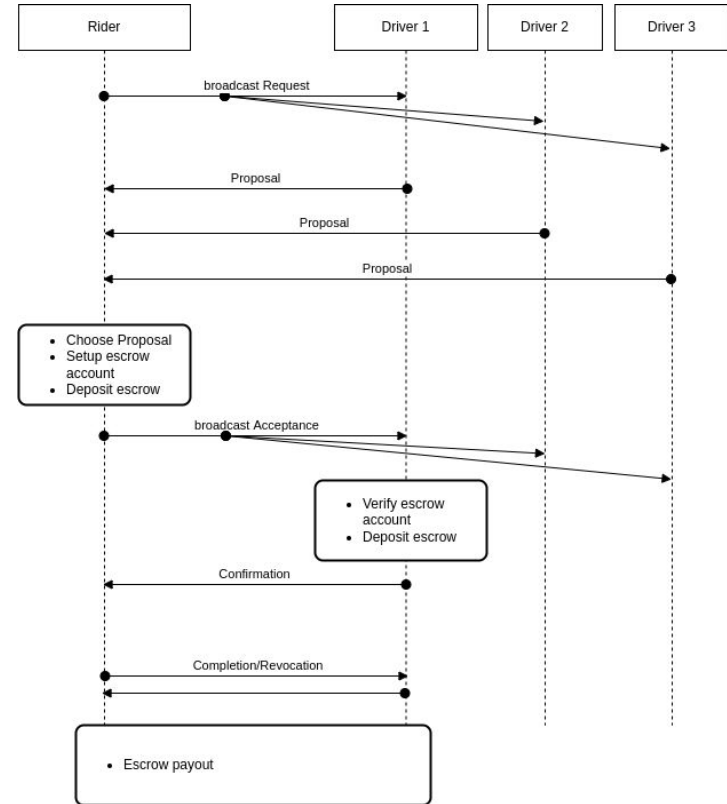

Acceptance - Passenger accepts a proposal, sets up the escrow account including their deposit, and broadcasts an acceptance message

4

Confirmation - Driver checks the escrow account, and sends a confirmation directly back to passenger

5

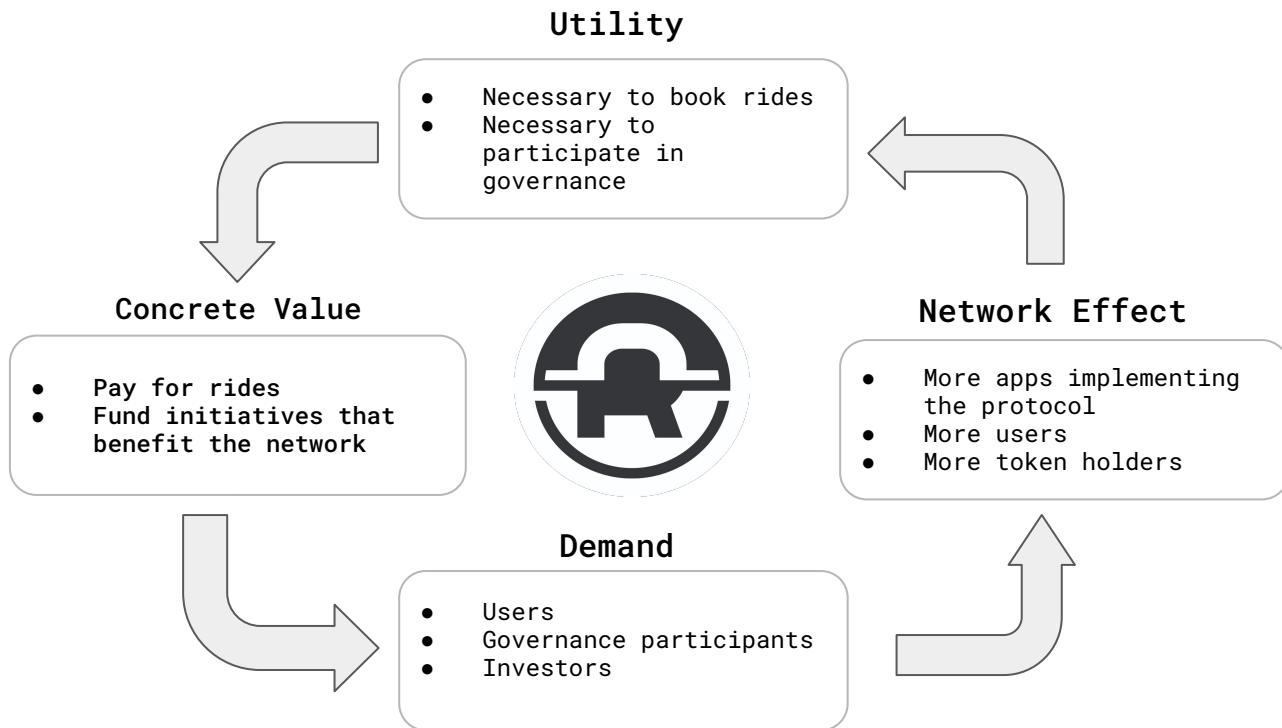

Revocation/Completion - Users revoke or attest to the completion of the pickup, and escrow is released.

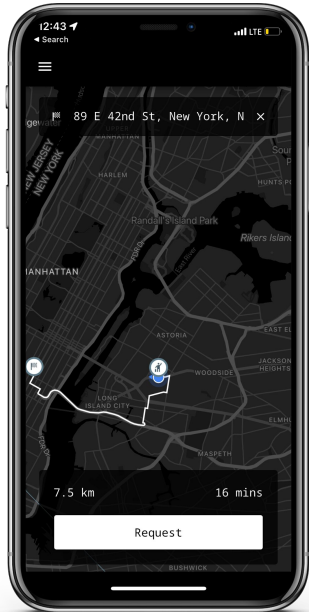

nRide Token

nRide fosters a token economy that puts the value of the network in the hands of its users.

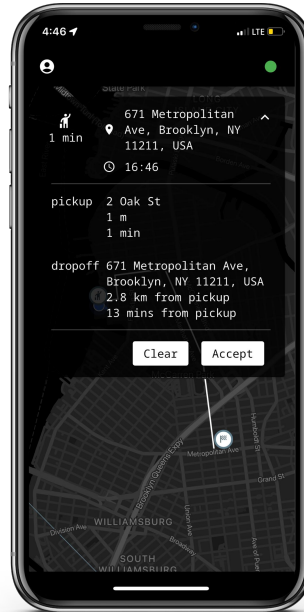

Applications

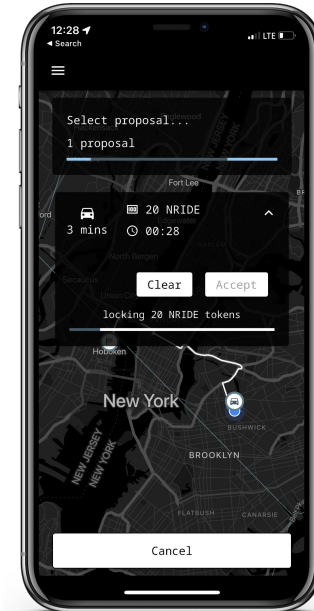

The nRide mobile application is currently in public Beta. This first implementation of the protocol will lead the way for other projects to join the network and to form an ecosystem of compatible ride-hailing applications sharing a common pool of users.

Passenger - Request

Driver - Accept

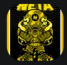

Passenger - Confirmed

DAO - live on DAO DAO

By staking tokens in the nRide DAO, users can vote on governance proposals to update protocol parameters, or spend tokens from the treasury to fund initiatives that benefit the community.
